NeatRescue — Team SFAB — neatHack 2026

12-month business plan | October 2026–September 2027 | USD

Status: early-stage concept and synthetic demonstration. All commercial projections below are hypothetical estimates, not customer traction, committed funding or audited results.

Product and evidence

NeatRescue is an AI agent that investigates software failures and independently verifies proposed repairs. The proposed value is reducing the risk of accepting a plausible but incomplete fix. Independent verification is a workflow design, not a guarantee of correctness.

User-reported facts: zero customers, zero revenue, $0 actual cash and no committed funding. The synthetic experiment showed 4 incorrect payment rows, 1 row after an incomplete fix, and 3 correct rows after independent verification. These are synthetic observations, not customer payments. The stages are not a statistically validated accuracy benchmark; no accuracy percentage, paid adoption or avoided financial loss is claimed. No production reliability, security certification or willingness-to-pay evidence has been verified.

Intended customer and route to market — proposals

Start with small engineering teams maintaining payment or data workflows, where a missed regression has a clear cost. The initial buyer is an engineering lead; the user is a developer or on-call engineer. Position the product as an evidence-producing investigation and verification assistant, not unrestricted autonomous production repair.

Recruit design partners through developer communities, the hackathon network and direct founder outreach. Offer a sandbox pilot with explicit acceptance criteria and an audit trail. First demonstrate reproducible failure investigation, then charge for verified workflow usage. The model’s acquisition budgets are spending caps, not evidence that those budgets will generate the projected customers.

Hypothetical pricing and metering

- **Starter: $49/month**, including 100 completed verification jobs; expected use 120 jobs/customer/month.
- **Team: $199/month**, including 600 jobs; expected use 800 jobs/customer/month.
- **Usage add-on: $0.10 per completed verification above the allowance.** This is an add-on, not a separately forecast standalone pay-as-you-go product. Subscription plus assumed usage gives effective monthly bills of $51 and $219.
- Define a billable verification as one independent verification workflow, not one model call. Internal retries and multiple calls count toward workflow cost. Meter completed work, provide budgets and explain failure/retry billing before launch.
- Model jobs and plan allowances are draft assumptions. Validate provider bills per workflow before offering uncapped usage.

Cost assumptions and margin policy

Every cost is an editable hypothetical budget, not a vendor quote. Inference is $0.050, variable compute $0.015 and variable logging $0.005 per verification, giving $0.070/job. Variable support is $2/Starter or $12/Team per month; payment fees are 3% of revenue.

Monthly fixed delivery budgets: hosting $60, compute $40, logging $25 and support $100, totaling $225. Security is $75/month in operating expense; acquisition is $150/month in base, $75 conservative and $300 growth. One-time launch expense is $200. These budgets do not buy an audited security program or fully staffed support operation.

Gross profit deducts variable delivery costs, processing fees and the $225 fixed delivery budget. Security, acquisition, founder pay and launch cost are below gross profit. Per-customer contribution before fixed costs is $39.07 Starter (76.6%) and $144.43 Team (65.9%). The base 2:1 Starter/Team mix averages $107 revenue and $74.19 contribution per customer/month.

Pricing guardrail: $0.10 overage breaks even at about $0.077 inference cost/job after assumed compute, logging and payment fees. At $0.15 inference, each additional overage job loses about $0.073 before support/fixed costs. Reprice, cap expensive jobs or change model routing before scaling such usage. The saved sensitivity table tests $0.025, $0.050, $0.150 and $0.300 inference against 2%, 5% and 10% monthly churn.

Scenario method

All cases begin with zero existing customers. New customers pay for a full month on arrival; churn removes a fraction of the opening customer base before billing. Customer counts are expected values and can be fractional; they are not signed contracts. New monthly additions compound, with no sales-capacity constraint. Actual future performance may be zero.

- **Conservative:** first-month additions 1 Starter + 0.25 Team; additions grow 3% monthly; churn 8%; acquisition budget $75/month.
- **Base / Main Scenario:** 2 Starter + 1 Team; additions grow 10%; churn 5%; acquisition budget $150/month.
- **Growth:** 4 Starter + 2 Team; additions grow 15%; churn 3%; acquisition budget $300/month.
- **Bootstrap $5,000:** base operating assumptions with a hypothetical $5,000 opening capital balance. This is not revenue and is not committed funding.
- **Bootstrap no-sales stress:** hypothetical $5,000 cash, zero customer additions and the base spending budget retained. This tests the risk of no paid adoption.

The native tables below contain monthly revenue, costs, gross margins, profit, burn, cash and annual scenario comparisons. Other pages hold editable inputs, monthly plan detail and inference/churn sensitivity.

What the saved forecast says

Conservative / base / growth generate approximately $7,062 / $31,650 / $83,648 of 12-month revenue. Month-12 expected customers are 12.0 / 52.0 / 155.2. Annual gross margins are 32.9% / 60.8% / 66.1%. Operating profits are $320 / $16,345 / $50,599 before tax and with unpaid founders.

Recurring operating break-even is 7 mixed-plan customers in base and conservative, and 9 in growth, at each case’s modeled mix and costs. It excludes the one-time launch cost. Base monthly operating profit first turns positive in November 2026; conservative in March 2027. This is cash operating break-even, not a salary-funded business or proof of demand.

Cash runway and funding decision

Actual cash runway is zero today. All unfinanced commercial forecasts cross below zero in October 2026. Base requires at least $427.43 to cover its modeled peak deficit; conservative requires $1,017.15; growth $354.86. These are bare model deficits, not recommended funding targets. Later positive cash assumes those earlier gaps can somehow be funded; the model does not silently add funding.

With the hypothetical $5,000 bootstrap and base acquisition, lowest cash is $4,572.57 and month-12 closing cash $21,344.74; cash stays above zero throughout the 12-month horizon, not necessarily forever. With **no customers**, cash costs are $450/month plus $200 launch expense: $5,000 covers 10 full forecast months and falls below zero in **August 2027** (month 11), closing September at $(600). Monthly cash snapshots omit within-month timing, so a prudent cash buffer must sit above the modeled minimum.

12-month execution plan — proposed targets, not commitments

Months 1–3 (Oct–Dec 2026): make the synthetic demo reproducible; instrument inference/compute/logging per completed workflow; recruit design partners; define repair authorization, sandboxing, independent checks and rollback boundaries. Seek a first paid pilot only after acceptance criteria pass.

Months 4–6 (Jan–Mar 2027): test Starter/Team willingness to pay, metering and spend caps; compare retained paid usage against the base assumptions; track false acceptance/rejection separately; document incidents and security limitations. Stop or reprice usage with negative contribution.

Months 7–9 (Apr–Jun 2027): improve model routing and verification coverage; add least-privilege credentials, redaction, retention controls and audit logs; measure cohort churn and support time before raising acquisition spend.

Months 10–12 (Jul–Sep 2027): decide whether to continue, narrow the use case or raise funding using real retention, cost and verification evidence. Replace assumptions with measured data. Do not present hypothetical customers as traction.

Limitations and validation gates

Founder salary is explicitly $0, a draft unpaid-founder assumption. No employees or contractors are modeled. Taxes, legal costs, insurance, paid certifications, material onboarding effort, refunds, bad debts, working-capital delays, debt, depreciation and capital expenditure are excluded. All cash collections/payments happen in their revenue/expense month. Profit therefore equals modeled net cash flow, not GAAP net income. No financing arrives during the plan. Add these costs and terms before making hiring or funding commitments.

Important risks: insufficient demand, high inference/retry costs, unsafe repair permissions, correlated errors despite independent verification, sensitive-code exposure, logging retention, support workload and churn. A production claim needs evaluation on real consented workloads with predefined pass/fail rules, failure cases and reproducibility—not this single synthetic example.

Model checks and submission use

Saved monthly profit and cash were checked against an independent arithmetic recurrence in all three operating cases and the bootstrap case. The base sensitivity cell matches the base forecast. Synthetic facts remain isolated from revenue formulas. The simulator previews inference, churn and acquisition growth locally without editing saved values; use the native assumptions tables or its

scenario action to save a change. The simulator is render-checked in light and dark themes; button clicks and live keyboard interaction are not browser-tested.

This report is a dated submission draft, not investment advice or a commitment. Sources: the team’s facts in this chat; all prices beyond $49/$199 and every operating/adoption assumption are Ari’s disclosed proposals, not external research or verified vendor prices. PDF/Excel exports are snapshots; the cfo.ai model remains editable.

Scenario comparison — hypothetical USD

All operating plans exclude founder salary and tax. $5,000 is hypothetical capital, not revenue or committed funding.

Metric	Base	Conservative	Growth	$5,000 base	$5,000 no sales
12-month revenue	$31,649.65	$7,062.13	$83,648.39	$31,649.65	$0.00
